Intro

- *This guide has been written to help people value the cost of cards when creating custom content -*

When I first started making lua scripts, I kind of just guessed what the purchase cost should be for the cards I made based on rough equivalents I saw in the base set cards of the game. But as I get more confident in coding and started to make more complex card effects, I started paying more attention to patterns and slight variations across official cards. So I thought I'd capture it here for other people who want to make their own custom cards and scripts, in the hope it makes it easier to value cards in the same ballpark as existing cards. (Of course, if you plan on making an entire custom set, that you intend not to ever be mixed with official cards, you can ignore this completely. But if do intend for them to be mixed, you'll probably want a bit of parity.)

My intention was initially to just provide a very short document – not much more than a table assigning a points value to each effect, and another table outlining the total point-value for cards at cost-level. However, as I started taking screen-grabs of cards to compare them more directly, I ended up with something much longer. ***So if you just want a rough guide to effects and total card cost values, you need only read pages 3-5 of this document.***

If you want to understand my rationale for the values I landed at (some of which are far less straight forward than I expected) and the assumptions I've made on the way, then dive into the rest of the document. This obviously isn't an exact science. (Maybe it was for Darwin and the WWG team, but for me reverse-engineering the system as a non-game-designer, it wasn't.) So I fully welcome feedback and debate about where my system and assumptions may be wrong.

Finally, a disclaimer – most, if not all of my custom scripts were written before I gave this much attention to card values – so if you play any of those scripts and think I haven't followed my own rules, that's why.

The general Framework

Points per Card Cost

The way I think about card balance (and therefore, the statistics and effects that are reasonable to add to a custom card) is that each effect or statistic is worth a number of points, and that cards of a certain value (purchase cost) will grant you a certain number of points.

Card cost (gold)	Effect points
1	5
2	6
3	7-7.5
4	8-9
5	10-11
6	12-13.5
7	14-15
8	16-18

Basic Effect Cost

Below is my list of the cost of an effect being the main card effect. (i.e. not an Ally or Sacrifice effect.)

1 point		
• 1 combat • 1 gold • 2 health • Cycle (Draw 1, discard 1)	• Guard ability (for a champion) • 1 defense (for a champion) • When acquired, put on the bottom of deck.	• 1 combat (or gold) per card of same faction in play • 2 combat per champion of same faction in play • 'Or' (One effect or another)

1.5 points - Acquire a champion/action to top-deck (one or the other)

1.75 points - Stun target champion of cost 4 or less.

2 points		
• Discard 1 • (i.e. force opponent to discard)	• On acquire, card goes to bottom of your deck	• Sacrifice a card from hand only

3 points		
• Draw 1 • 2 gold	• Sacrifice from hand or discard pile • 2nd cycle (draw 1, discard 1)	• Acquire a card to top-deck • Acquire a Fire Gem for free into your hand

3.5 points – Stun a champion

4 points		
• Gain 3 gold • Prepare a champion	• Put a champion from discard on top of your deck • Put an action from discard pile on top of your deck	• Cycle 2 (Draw up to 2, discard that many)

5 points		
• Draw a second card*	• Put an action or item from discard pile on top of your deck	

**The value of drawing 2 cards in a turn is worth more than double the value of drawing 1 due to the increased probability of triggering faction effects.*

6 points		
• Gain 4 gold**	• Acquire a card to hand • Acquire a FG to hand for free	• Prepare all champions • Put a card from discard to top of deck

*** Maybe this is only worth 5.5 points*

8 points		
• Draw 2 cards	• Acquire a card into your hand	• Put a champion from your discard into your hand

Conditional Effect Values

Conditional effects include:

- Ally effect (single)
- Sacrifice ability
- if you have 2 or more champions in play
- if you have a stunned a champion this turn
- for each card of <faction> you have in play

For these conditional effects, the value-cost is halved. I.e. 1 combat as a main card effect is worth the same number of points (1 point) as a faction effect for 2 combat.

In the few instances we currently see of cards with **Double Ally effects** (e.g. Full Moon's Call) I have assessed these effects as being divided by 3.

Other effects

Vampire effect (Sacrifice a card and gain X combat): the value of this effect seems to be based solely on the cards effect by itself. That is 3 points for sacrifice from hand or discard (or 2 points if sacrifice from hand only) + the combat value granted (1 point per combat).

E.g. Lys's effect: Sacrifice a card from hand or discard, if you do gain 2 combat = 3 + 2 = 5 points.

X combat for each guard = 0.5 point per combat granted

X combat for each champion = 1 point per combat granted

X health for each champion = 1 point per 2 health granted

Per card/champion of a faction

- +1 combat per faction card = **1 point**
- +1 combat per faction champion = **0.5 point**
- +1 gold per faction card = **1 point** (noting this doesn't scale as per other gold effects)

Using the above as a guide, aim to value the card at the low-end of its scale (e.g. 10 points for a 5-cost card, or 12 points for a 6-cost card) if not lower to compensate for any extra value you gain as a result of the effect having no ceiling.

For each champion opponent has in play – use the same guidance as 'per card/champion' above, again aiming to make the base value at the low-end of the scale.

If you've stunned a champion / The next time you stun a champion this turn gain X gold – These effects appear to be based on the raw value of gold granted, and then halved given the condition.

E.g. Pit Trap – "The next time you stun a champion this turn gain 2 gold" = $3 \text{ points} \div 2 = 1.5 \text{ points}$.

E.g. Ren, Bounty Hunter - "If you've stunned a champion this turn gain 3 gold" = $4 \text{ points} \div 2 = 2 \text{ pts}$.

AoE damage – whether the effect hits your opponent and their champions, or only their champions (as with Kalibok) the effect should be **valued on the basis that it hits 2 targets**.

E.g. "Deal 4 damage to target player and their champions" would be valued at $2 \times 4 = 8 \text{ points}$.

E.g. "Deal 2 damage to each opposing champion" would be valued at $2 \times 2 = 4 \text{ points}$.

If you played a champion this turn (including this one) – these effects appear to be valued on the raw score of their effect, and on the basis they trigger every turn. (I assume, on the assumption they don't stick on the board for more than one turn.)

E.g. Teague, the Breaker – "If you played a champion this turn.. gain 5 combat" – would be valued at 5 points.

Personally, if you do want to use these effects, my steer is to either assign a lower point-value to the effect, or make these effects a bonus in addition to a primary effect that triggers every turn.

Token-generating effects – add the value of effects from the token to other effects on the main card.

Other unique effects – At the time of writing, there were 14 cards with unique effects. I'm not going to outline them here. [Jump to the end of the doc](#) to see how I valued each of them.

Basic stats & simple comparisons

Let's start by sense-checking this against some straightforward cards.

Whilst Borg comes in under the point range, it is an exception to the rule – but one which also lends itself to the fact that some cards will be slightly better or worse value than others.

Guard = 1 point
Defense = 3 points
Combat = 2 points
Total = 6 points

Guard = 1 point
Defense = 6 points
Combat = 4 points
Total = 11 points

Guard = 1 point
Defense = 7 points
Combat = 6 points
Total = 14 points

Let's make some other simple comparisons

Arms Dealer is just Profit as a champion with 2 defense. Which is why it costs 2 more gold.

Profit – Gain 2g = 3pts;
4 combat (faction) = 2 pts → 5 pt total

Arms Dealer – As above with +2 defense (2 pts) → 7 pt total

And similarly, Leandra vs Flame Wing. As 4-cost cards they should be coming in at 8-9 points.

Both fall into the **8-9 point** range for a 4g cost card, with Leandra being slightly better value – but only if you can trigger the faction ability.

Remove the faction bonus from both cards and they are statistically the same. But this is also where play style and player preference comes in. Flame Wing may be less likely to stick on the board, but if it does, it will give you more base damage than Leandra.

Guard = 1 point
Defense = 4 points
Combat = 2 points
Faction = $4 \div 2 = 2$ pts
Total = 9 points

Guard = 1 point
Defense = 3 points
Combat = 3 points
Faction = $3 \div 2 = 1.5$ pts
Total = 8.5 points

Here are some less straight forward comparisons:

Just looking at card values here, it's easy to see some patterns and comparisons we can make.

Draw 1 = 4 combat (Dire Wolf and Parov are otherwise the same).

3 health = 1 combat (Parov and Cristov are otherwise the same)

The thing is, things aren't entirely straight forward. If you look at the point system at the start of this article, you'll see that I give 'Draw 1' a value of 3 points, which is obviously less than the 4 points for 4 combat from Dire Wolf.

Also, if we look Darian War Mage: If 3 health = 1 combat, then Darian's ability just doesn't make sense. You'd be crazy to ever take the health at that exchange rate. Surely the two options on a card with an 'or' effect should be roughly equal in power, right?

Well, yes, but not exactly. And this is part of what makes some cards slightly better or worse value than others.

Let's say for a moment that 2 combat (not 1) is equal to 3 health.

For Darian, the choice seems more fair. 3 combat would be equal to 4.5 health, but as we can't grant half a health point, it's rounded down.

Returning to the Parov-Cristov comparison, Parov's 3 combat would be the equivalent to Cristov's 2 combat and 1.5 health. (Making Cristov's actual 2 combat and 3 health better value than Parov's 3 combat.)

So... all of this is to say that, whilst I've aimed to make as many direct comparisons (between cards of equal cost, and cards of differing costs but with similar effects), this isn't an exact science. It's my best attempt at noticing the *general* pattern of things. I fully extend the invitation for you to assess any card in the game against my system and let me know if it's wildly off. (I'll be honest: I haven't done this for all 215 cards in the app at the time of writing.)

Yes, some cards will present slightly more or less value according to this system – my hope is that the system reflects what the majority of the community feels in terms of card value. (E.g. As in the above example, Borg comes out as poor value for its cost – something I feel the community would agree with.)

Let's do some quick sense checking:

1 cost cards (**5 points**)

Combat = 3 points Discard = 2 points Faction = 1 point Total = 6 points	Gold = 3 points Faction = $3 \div 2 = 1.5$ Total = 4.5 points	Combat = 3 points Faction = $1 \div 2 = 0.5$ Sac = $3 \div 2 = 1.5$ points Total = 5 points	Gold = 1 point Sac from H/D = 3 Faction = $2 \div 2 = 1$ Sac = $2 \div 2 = 1$ point Total = 5 points
---	--	---	---

Spark actually comes out ahead, hitting the 6-point value of a 2-cost card, while Taxation comes out as less valuable. (Again, two sentiments I often hear from the community.)

At the other end of the spectrum, here's what some of our 7-8-cost cards (**14-15 points**) look like:

Combat = 6 points Health = 3 points Draw 1 = 3 points Faction = $4 \div 2 = 2$ Total = 14 points	Guard = 1 point Defense = 7 points Combat = 4 points Discard = 2 points Total = 14 points	Defense = 6 points Gold = 3 points Combat = 4 points Sac from H/D = 3 Total = 16 points	Defense = 7 points Combat = 4 points Stun = 3.5 points Total = 14.5 points
---	--	--	--

I'm surprised Domination didn't come out higher. Personally, it feels like the best of this bunch to me. And at 16 points, Gorgar could arguably cost 8 gold (**16-18 points**).

Guard = 1 point Defense = 6 points Combat = 5 points Draw 1 = 3 points Faction = $3 \div 2 = 1.5$ Total = 16.5 points	Guard = 1 point Defense = 7 points Combat = 6 points Cycle = 1 point Faction = $2 \div 2 = 1^*$ Total = 16.5 points	Guard = 1 point Defense = 6 points Combat = 4 points Sac from H/D = $3 \times 2 = 6$ Faction = $3 \div 2 = 1.5$ Total = 18.5 points**	Combat = 8 points Stun = 4 points Draw = 3 points Sac = $5 \div 2 = 2.5$ Total = 17.5 points
---	---	---	---

* Just as Draw 2 effect on a single card is worth more than double the value of a Draw 1, so too do I assume that a second cycle (draw 1, discard 1) is worth more than the first.

** Whilst Tyrannor has a huge point value (above the top value of 18 I put in the table at the start of the document), we need to remember that its value decreases as the game goes on. You aren't always likely to be able to, or want to sacrifice 2 cards every time you play it. (Even skipping on 1 sac would drop his value rating to 15.5 – lower than any of the other cards.) I think this 'low floor, high ceiling' aspect offsets the high 'raw' value and makes it a reasonable set of effects for the card.

As for the Dungeon and Dungeon Promo 8-costers, they're also within the **16-18 points** range.

Gold = 5.5 points Draw 2 = 8 points Sac = $7 \div 2 = 3.5$ Total = 17 points	Guard = 1 point Defense = 7 points Health = 3 points Combat = 6 points Total = 17 points	Defense = 6 points Gold = 3 points Health = 1.5 points Draw = 3 points Faction = $5 \div 2 = 2.5$ Total = 16 points	Guard = 1 point Defense = 7 points Combat = 6 points Faction = $(3+4) \div 2 = 3.5$ Total = 17.5 points
--	---	---	--

Now let's compare similar cards at different cost-values:

According to these calculations, Command and Cristov are equitable - and both at the higher end of value for a 5 cost card. One could argue that Command is overall better, because you always get all of its value, whereas with Cristov, you have to have another Imperial in play to get the faction bonus.

However, as a champion, if Cristov stays on the board for more than 1 turn, you obviously get more value from it than a single play of Command.

Card cost = 10-11 pts

Gold = 3 points
 Combat = 3 points
 Health = 2 points
 Draw 1 = 3 points
Total = 11 points

Card cost = 10-11 pts

Guard = 1 point
 Defense = 5 points
 Combat = 2 points
 Health = 1.5 points
 Faction = $3 \div 2 = 1.5$ pts
Total = 11 points

Card cost = 14-15 pts

Guard = 1 point
 Defense = 6 points
 Gold = 3 points
 Combat = 3 points
 Health = 2 points
 Faction = $3 \div 2 = 1.5$ pts
Total = 16.5 points

And this is part of what I think makes this game so fun – simple differences like this are valued differently by different players in different contexts.

Also, Drakkon represents insane value, with a similar points value (16.5) as Arkus and Grak (both 8-cost cards)

Compounding values

Gold and Draw

A quick word on Gold and Draw/Cycle effects.

Whilst I have given Combat and Health flat values (1 point for 1 combat and 1 point for 2 health), I have not done this with Gain Gold effects or Draw effects.

Simply put, the value of drawing 2 cards is worth more than double the value of drawing 1 card – because you substantially increase your chances of hitting faction bonuses. As such, I've valued Draw 1 at 3 points, and Draw 2 at 8 points. (And therefore, I have listed above, 'Draw second card' separately at a value of 5 pts. This is to show how you'd value it as a faction effect, as with Lumina Greylocks.)

Similarly, I've done the same with Gold. As 1 card granting 4 gold is worth way more than four cards granting a single gold each.

Cycle

Card cost = 6 pts Gold = 3 points Cycle = 1 point Faction = $4 \div 2 = 2$ Total = 6 points	Card cost = 6 pts Gold = 1 point Combat = 2 points Cycle = 1 point Sac = $3 \div 2 = 1.5$ Total = 5.5 points	Card cost = 12-13 pts Combat = 6 points Cycle 2 = 4 points Option to cycle: 1 pt Total = 11 points	Card cost = 16-18 pts Guard = 1 point Defense = 7 points Combat = 6 points Cycle = 1 point Faction = $3 \div 2 = 1.5$ Total = 16.5 points
---	---	---	---

Looking at Elven Gift, it seems straight forward to work out the value of cycle. Other 2 cost cards come in at a point value of about 6 pts. Which gives cycle just a value of 1. (This also fits the calculation of draw (3) – discard (2).) Similarly, the value fits Explore – even if it does come in under the value of 6 points, it's still above the value of 5 we expect from 1-cost cards. (That said, Explore requires you to cycle, whereas Elven Gift does not, so it makes sense that it is less valuable as a card. Whether it's better positioned as a low-value 2-cost or should have been a high-value 1-cost is a debate for another time.)

The effects of Rampage and Grak are less straight forward.

As outlined above, the value of Draw 2 on a single card (8 pts) is worth more than double than value of Draw 1 (3 pts). So I assumed the same for Cycle 2. Assigning a value of 3 pts for the second cycle fits when applied to Grak, bringing him into the correct range (16-18 pts) for an 8-cost card. (This is based on the calculation of Draw 2 (8pts) – 2x Discard (2 points) = 4 points.)

However, this value leaves Rampage looking like very poor value – which personally, I do not think it is (especially when playing Ranger). It may be that the flexibility to cycle 0-2 cards has a value I have not captured above, that would bring Rampage into the expected value range for its cost.

Card cost = 14-15 pts
 Combat = 7 points
 Effect value: 7-8 pts

Let's also consider Pack's Fury. Unlike the above cycle cards, this one requires you to discard *before* drawing. But it also has no limit (beyond the cards you have in your hand). In most circumstances this is a limit of 4 cards. That said, I think it's a very rare case that a player would discard 4 cards.

Let's just pause, and return to the standard cycle effect of draw then discard to consider value calculation:

1 cycle: 1 point = Draw 1 – Discard 1 (3-2=1)

2 cycle: 4 points = Draw 2 – Discard 2 (8-4=4)

3 cycle: 11 points = Draw 3* – Discard 3 (17-6=11)

* (Draw 3 is discussed far below, with Full Moon's Call.)

If this is true, then a normal cycle 3 is valued higher than Pack's Fury effect. Of course, we can't forget that drawing first, then discarding is fundamentally different to discarding first then drawing. I assume this is why the effect on Pack's Fury comes out at the lower value of 7-8 points.

But Pack's Fury let's you cycle up to 4. As I said above, it's unlikely that a player will do this, and if they do, it's less likely to be done often. I assume the value is based on an average cycle of 2-3 cards and anything above that is considered a bonus, inherent in cards with 'low-floor and high-ceiling' effects. (If you only cycle 1-2 cards with Pack's Fury, you're effectively getting sub-optimal value.)

Stun target champion

Thrash gives us a straight up exchange rate (or at least, a close comparison), suggesting a value of 4 points. That said, as we'll see below, other cards with 'or' effects don't usually have two effects that are exactly equal in value. So it may be that Stun is worth more or less than 4 points.

If we consider that the defense value of champions ranges from 1 to 7, then the mid-point value is 3.5. Whilst it's likely an over-simplification to say that 3.5 is the average value of damage you'd get from a stun effect (because we're ignoring the distribution of champion defense values), it's not a bad place to start. And my intention here isn't to provide a water-tight scientific analysis of values. A value of 3.5 feels accurate enough. Let's sense-check this with some other cards.

Card cost = 7-7.5pts
 Combat = 1 point
 Draw = 3 points
 Faction = $3.5 \div 2 = 1.75$
Total = 5.75 points

Card cost = 8-9 pts
 Combat = 7 points
 Faction = $3.5 \div 2 = 1.75$
Total = 8.75 points

Card cost = 10-11 pts
 Defense = 5 points
 Combat = 2 points
 Stun = 3 points
 Faction = $3 \div 2 = 1.5$
Total = 11.5 points

Card cost = 10-11 pts
 Defense = 5 points
 Combat = 4 points
 Faction = $3.5 \div 2 = 1.75$
Total = 10.75 points

Card cost = 14-15 pts
 Defense = 7 points
 Combat = 4 points
 Stun = 3 points
Total = 14 points

Card cost = 14-15 pts
 Combat = 8 points
 Draw = 3 points
 Faction = $3.5 \div 2 = 1.75$
Total = 12.75 points

Card cost = 16-18 pts
 Guard = 1 point
 Defense = 7 points
 Combat = 6 points
 Faction = $(3+3.5) \div 2 = 3.25$
Total = 17.25 points

Broadly, **3.5 points for Stun** seems to fit the bill, even if some cards are slightly more/less than their expected total point value.

Prepare target champion

Unlike Stun a champion, there is no immediate comparison value available for Prepare a champion. So I did some reverse engineering and settle on a value of 4 points for this effect.

Card cost = 10-11 pts Guard = 1 point Defense = 5 points Combat = 4 points Sub-Total = 10 Remainder = 0-1	Card cost = 10-11 pts Gold = 5.5 pts Faction = 2 pts Sub-Total = 7 Remainder = 3-4	Card cost = 12-13.5 Guard = 1 pt Defense = 5 pts Combat = 2 pts Draw = 3 pts Sub-Total = 11 Remainder = 1-2.5 As a faction effect ÷2	Card cost = 14-16 pts Defense = 6 pts Combat = 4 pts Health = 2 pts Sub-Total = 12 Remainder = 2-4
---	---	--	--

Card cost = 8-9 pts Combat = 5 points Health = 2.5 points Sub-Total = 7.5 Remainder = 1-2 As a faction effect ÷2	Card cost = 14-16 pts Combat = 6 points Health = 3 points Draw 1 = 3 points Sub-Total = 12 Remainder = 2-6 As a faction effect ÷2
--	--

As mentioned, from the above, I have settled on a value of 4 points for 'Prepare a Champion'. Using that value, Merriglow comes out as great value for a 5 cost card.

Oddly though, Domination comes out as just scraping in at the lower end of what you'd expect. This is one card that really makes me question my system, as in-game, Domination feels like great value.

Prepare all of your champions

Card cost = 14-15 pts

Gold = 4 points

Combat = 4 points

Health = 2.5 points

Sub-Total = 10.5

Remainder = 3.5-4.5

As a faction effect ÷2

Card cost = 16-18 pts

Combat = 5 points

Health = 2.5 points

Draw 2 = 8 points

Sub-Total = 15.5

Remainder = 0.5-2.5

As a faction effect ÷2

Unfortunately, there is no overlap in the remainder values. So if we take the mid-point (3) and double it as a both cards have this effect as a sacrifice effect, we'd land on a value of 6 points. To me, that feels a little light on, but this may just be reflective of an effect that has an incredibly high ceiling (but could also have no impact at all, if you draw it when you have no champions in play).

It may also be that one or both of these cards are overpowered, and better value than other cards of equivalent costs.

Put a Champion from discard to hand

Card cost= 12-13.5 pts

Combat = 9 points

Faction = $3 \div 2 = 1.5$

Sub-Total = 10.5

Remainder = 1.5-3

As a sac effect ÷2

Card cost = 14-15 pts

Defense = 5 points

Faction = $4 \div 2 = 2$

Sub-Total = 7

Remainder = 7-8

Only two cards to assess here.

I'm going to take the higher value from DeMoss and say this is worth **8 points**.

Put a Champion from discard to top of deck

Card cost = 6 pts Gold = 3 points Combat = 2 points Sub-Total = 5 Remainder = 1 as a sac effect (so x2 = 2 pts)	Card cost = 7-7.5 pts Gold = 3 points Sac from H/D = 3 pts Sub-Total = 6 Remainder = 1-1.5 as a faction effect (so x2 = 2-3 pts)	Card cost = 7-7.5 pts Gold = 4 points Sub-Total = 4 Remainder = 3-3.5 as a faction effect (so x2 = 6-7 pts)	Card cost = 10-11 pts Defense = 3 points Faction = $3 \div 2 = 1.5$ Sub-Total = 4.5 Remainder = 5.5-6.5
--	---	---	--

Hmm... Soul Transfer and Grave Robbery come out similar, suggesting a value of 2-3 points – which feels low for this kind of effect. Whereas Afterlife and Varrick would suggest a value of 6-7 points.

Maybe I haven't got the right values for gold or sacrifice effects... but I'm going to settle on **4 points** for the following reasons:

- the above effect to put a champion to *hand* from discard (valued at 8 points)
- the below effect to put *any* card from discard to top of deck (valued at 6 points)
- the situational nature of this effect means it's not always going to have a target to be used. (Another instance of 'low floor, high ceiling'.)

Put an Action/Item from discard to top of deck

Card cost = 10-11 pts Defense = 4 points Faction = $3 \div 2 = 1.5$ Sub-Total = 5.5 Remainder = 4.5-5.5	Card cost = 10-11 pts Defense = 4 points Guard = 1 point Combat = Ignore 'Or' = 1 point Sub-Total = 6.5 Remainder = 3.5-4.5
--	--

If 'put a champion from discard pile on top of your deck' is valued at 4 points, then it makes sense for the action-equivalent to be valued similarly.

This tracks, as we can see, with Pelleas. Alexis effect appears valued slightly higher, likely representing the expanded range of targets (of actions *or* items).

Overall assessment:

'Put an action from discard pile on top of your deck' = 4 points

'Put an action or item from discard pile on top of your deck' = 5 points

Put any card from discard to top of deck

Card cost = 7-7.5 pts
 Discard = 2 points
 Top-deck = 6 points
 Sac = $3 \div 2 = 1.5$
Total = 9.5

Card cost = 12-13 pts
 Combat = 6 points
 Top-deck = 6 points
Total = 12

Card cost = 14-15 pts
 Gold = 7 points
 Combat = 5 points
 Faction = $6 \div 2 = 3$
 Sac effect = $4 \div 2 = 2$
Total = 17

We don't have many cards to assess here, and it would be easy to say that the 6 points I've assigned this effect is too much given two of the three cards come out ahead of their respective expected ranges. That said, Smash n Grab is the only card from the original (Base) set, and its value lands in the expected range.

Further, I think Crime Spree is an over-powered card. I may have over-valued what 5 gold is worth (as by the time you can buy Crime Spree, economy may be less of a concern for you).

Also, as a 3-cost card, Daring Escape is more likely to be purchased early game, when you have fewer market cards to get value from top-decking. If you don't use this effect, you're getting less value than a 1-cost card. (Low floor, high ceiling.)

Acquire a card to top of deck / hand

Card cost = 5 pts
 Gold = 3 points
 Faction = $3 \div 2 = 1.5$
Total = 4.5 points

Card cost = 7-7.5 pts
 Defense = 4 points
 Acquire = 3 points
 Faction = $2 \div 2 = 1$
Total = 8 points

Card cost = 8-9 pts
 Defense = 5 points
 Gold = 3 points
 Faction = $3 \div 2 = 1.5$
Total = 9.5 points

Card cost = 14-15 pts
 Gold = 6 points
 Acquire champ to top deck = 1.5 points
 Faction = $3 \div 2 = 1.5$
Total = 9 points

Let's start by just looking at the blue Guild cards above. Rasmus is effectively The House Always Wins (THAW) as a champion, and both points values are only 0.5 points off what we see with other cards. Illusionist is the odd one out here, because in-game I never buy it, as it feels too situational – it doesn't have the in-built economy like the other two cards, so if you draw it without any decent

amount of econ, you're getting a much lower return on investment. I'm surprised it scores so many points on my system.

Looking at The Summoning, it would seem odd to value 'acquire a champion' the same as 'acquire (any) card' – but even if we did, The Summoning would still rate lower than expected for a 7-cost card. So I've given it a value of 1.5 points, just to reflect it's utility applies to only half the cards in the market. It feels like an anomaly to me. Thematic, but excessively low-value. (I'm going to ignore its existence.)

Card cost = 7-7.5 pts
 Acquire = 8 points
 Faction = $3 \div 2 = 1.5$
Total = 9.5 points

Card cost = 10-11 pts
 Gold = 3 points
 Draw = 3 points
 Faction = $8 \div 2 = 4$
Total = 10 points

Card cost = 14-15 pts
 Gold = 4 points
 Acquire = 8 points
 Faction = $3 \div 2 = 1.5$
Total = 13.5 points

I've taken 8 points as a 'best-fit' value here. Whilst it puts Embezzle as great value, the in-game value of Embezzle, in my opinion, is lessened, because it has no in-built econ, and as a lower-cost card, if you buy it early game, you've likely not got much more than your starting econ to work with.

Acquire a fire gem to hand

Card cost = 8-9 pts
 Combat = 3 points
 Draw = 3 points
 Faction = $6 \div 2 = 3$
Total = 9 points

Card cost = 10-11 pts
 Acquire FG = 6 points
 Draw = 3 points
 Faction = $6 \div 2 = 3$
Total = 12 points

I've valued 'Acquire a Fire Gem for free into your hand' as the raw value of a FG (2g = 3 points, 3 combat = 3 pts).

Vampires & Ritualist (sac for combat/gold)

Card cost = 7-7.5 pts

Defense = 2 points
 Combat = 1 points
 Sacrifice = 3 points
 Extra combat = 1 point
Total = 7 points

Card cost = 12-13 pts

Defense = 5 points
 Guard = 1 point
 Combat = 2 points
 Sacrifice = 3 points
 Extra combat = 2 pts
Total = 13 points

Card cost = 14-15 pts

Defense = 6 points
 Combat = 3 points
 Sacrifice = 3 points
 Extra combat = 3 pts
Total = 15 points

Card cost = 10-11 pts

Defense = 5 points
 Sacrifice = 3 points
 Combat = 2 points
Total = 10+ points

There's nothing special about this effect – it's just a case of getting less value if you don't sac a card.

That said, Lucia gets more than standard value if you've sacrificed at least one other card from another effect.

Card cost = 8-9 pts

Defense = 4 points
 Guard = 1 point
 Sac from H/D = 3 pts
 Gold from self = 1 pt
Sub-Total = 9+ points

Farkir has a similar effect to Lucia, albeit granting gold, not combat.

Based on its effects if a single card is sacrificed (by itself) the card already has top value for a 4-cost card. This value only amplifies if you've sacrificed another card.

In terms of creating custom cards the value of this effect seems to be based solely on the cards effect by itself (i.e. not factoring in the bonus value from other cards raising its ceiling).

Sacrifice 2

Card cost = 14-15 pts

Defense = 5 points

Sac from H/D = $2 \times 3 = 6$ pts

Faction = $3 \div 2 = 1.5$

Total = 12.5 points

Card cost = 16-18 pts

Guard = 1 point

Defense = 6 points

Combat = 4 points

Sac from H/D = $3 \times 2 = 6$

Faction = $3 \div 2 = 1.5$

Total = 18.5 points**

No compounding value for being able to sacrifice 2 cards in one go, as the value of this effect diminishes as the game progresses and you have fewer cards you want to sacrifice.

If you control 2 or more champions

Based on raw values of the effects

Card cost = 10-11 pts

Defense = 5 points

Combat = 4 points

Total, no bonus = 9pts

If effect = 3 points

Total w draw = 12 pts

Card cost = 7-7.5 pts

Gold = 4 points

Total, no bonus = 4pt

If effect = $3 + 1.5 + 3 = 7.5$

Total w bonus = 11.5

Card cost = 8-9 pts

Gold = 4 points

Total, no bonus = 4pt

If effect = $8 + 1.5 = 9.5$

Total w bonus = 13.5

Assuming the 'if' effect is valued at half-cost

Card cost = 10-11 pts

Defense = 5 points

Combat = 4 points

If effect = $3 \div 2 = 1.5$

Total = 10.5 pts

Card cost = 7-7.5 pts

Gold = 4 points

If effect = $7.5 \div 2 = 3.75$

Total gold = 7.75pt

Card cost = 8-9 pts

Gold = 4 points

If effect = $9.5 \div 2 = 4.75$

Total w bonus = 8.75

Halving the total cost of any effects granted brings this condition into line with expected values of other cards.

That said, Packmaster McKenzie gets a better deal here, because it counts as one of the champions.

... for each of your champions

Card cost = 7-7.5 pts
 Combat = 5 points
 Faction = $3 \div 2 = 1.5$
Total, no bonus = 6.5
 Min Extra Combat = 2pt
 (2c, any champ)
Total, 1 bonus = 8.5

Card cost = 7-7.5 pts
 Defense = 4 points
 Guard = 1 point
 Combat = 2 points
Total, no bonus = 7
 Min Extra Combat = 0.5 pt
 (1c, guard only)
Total, 1 bonus = 7.5

Card cost = 8-9 pts
 Defense = 4 points
 Guard = 1 point
 Combat = 3 points
Total, no bonus = 8
 Min Extra Combat = 1 pt
 (1c for any champ)
Total, 1 bonus = 9

Here, all the two champions have minimum expected values, even when they trigger no extra combat from additional champions. With bonus combat from a single source, they land at the top end of the expected value. (Close Ranks, however, is 0.5 points under the minimum expected value with no bonus, and 1 point over if it gets bonus combat from a single champion.)

So I value these effects as:

“for each champion” = 1 point per combat granted

“for each guard” = 0.5 point per combat granted

Card cost = 6 pts
 Gold = 3 points
 Health = 1.5 points
 Faction = $1 \div 2 = 0.5$
Total, no bonus = 5 pt
Total, 1 bonus = 5.5

Card cost = 6 pts
 Defense = 3 points
 Gold = 1 point
 Or effect = 1 point
Total if take gold = 5pt

Card cost = 7-7.5 pts
 Defense = 3 points
 Gold = 3 points
Total, no bonus = 6 pt

Card cost = 12-13 pts
 Defense = 6 points
 Health = 1 point
 Draw = 3 points
Total, no bonus = 10pt

Unlike the cards we saw above, these cards all come in *below* the minimum value we'd expect from other cards at similar costs. My sense is to place similar values based on the cost of health we see

elsewhere in the game. That is: 1point for every 2 points of health granted per champion. (And halving the total cost where this effect requires a faction to trigger.)

This holds for effects that give both combat and health per champion. We just simply add values.

Card cost = 7-7.5 pts Combat = 4 points Health = 2 points Total, no bonus = 6 pt For each = 1pt for combat & 0.5 for health = 1.5 points Total, 1 bonus = 7.5	Card cost = 12-13 pts Defense = 6 points Guard = 1 point Health & Combat from self = 3 points Total, no bonus = 10pt Total, 1 bonus = 13 pts	Card cost = 7-7.5 pts Health = 2 points Faction = 3 ÷ 2 = 1.5 Total, no bonus = 3.5 pt Total, 1 bonus (+1) = 4.5 pts Total, 2 bonus (+3) = 7.5 pts
---	--	---

The pattern appears to be that cards with “per champion” effects have a base value lower equal to a card that costs 1 gold less. (Weyan and Man at Arms seem to be exceptions to this rule, but they still only hit the minimum value of cards of similar costs.) And that cards granting combat per champion will meet the expected value with one extra champion in play; whereas health gains require 2+ champions to garner their minimum value.

Devotion is slightly the odd one out – firstly as it’s the only card granting gold per champion (complicated by the fact, as outlined above, that the value of gold seems to be compounding). Secondly, Devotion still comes in below value with 1 champion in play; it only reaches its minimum value threshold when at least 2 champions are in play.

The 'Or' mechanic

Card cost = 7-7.5 pts Defense = 4 points Combat/Sac = 2/1 pt 'Or' = 1 point Total = 6-7 points	Card cost = 7-7.5 pts Defense = 4 points Gold /Combat = 1/1 pt 'Or' = 1 point Faction = 4 ÷ 2 = 2 Total = 8 points	Card cost = 7-7.5 pts Defense = 4 points Gold/Combat = 1/2 'Or' = 1 point Total = 6-7 points	Card cost = 14-15 pts Defense = 6 points Gold/Combat = 6/5 'Or' = 1 point Total = 12-13 points
---	--	---	---

Seems to be a simple case of 1 point for 'Or' effects.

Per faction

Card cost = 6 pts Defense = 4 points Combat = 2 points Total, no bonus = 6 pt Total, 1 bonus = 7 pts	Card cost = 7-7.5 pts Defense = 3 points Combat from self = 2 Total, no bonus = 5 pt Total, 1 bonus = 6 pts Total, 2 bonus = 7 pts	Card cost = 7-7.5 pts Defense = 4 points Bonus from self = 2 Total, no bonus = 6 pt Total, 1 bonus = 8 pts	Card cost = 12-13 pts Defense = 6 points Bonus from self = 2 Faction = 2 ÷ 2 = 1 Total, no bonus = 9pt Total, 1 bonus = 11 pts Total, 2 bonus = 13 pts
1c per faction card = 1pt	1c per faction champion = 0.5pt	1g per faction card = 1pt (noting this doesn't scale as per other gold effects)	2c per faction card = 2pt

My assessment for effect values are in the bottom row of the table above.

For each champion opponent has in play

Card cost = 6 pts

Defense = 3 points

Gold = 1 point

'Or' = 1 point

Total if gold = 5 pts

Card cost = 8-9 pts

Defense = 5 points

Guard = 1 point

Combat = 2 points

Total, no bonus = 8 pt

Total, 1 bonus = 9 pts

This seems to be a similar case to effects based on champions you have in play. I.e. make the base value at the low-end of the scale (Trap Master; Master Weyan) if not lower (Apprentice TM; Tithe Priest) to compensate for any extra value you get given the card has no ceiling. Apprentice

Acquire to bottom of deck

This looks to me to simple be worth 1 point.

Card cost = 6 pts

Defense = 3 points

Combat = 2 points

Faction = $1 \div 2 = 0.5$ pt

Acq to bottom = 1pt

Total = 6.5 points

Card cost = 6 pts

Gold /Combat = 4/4 pt

'Or' = 1 point

Acq to bottom = 1pt

Total = 6 points

Card cost = 7-7.5 pts

Combat = 6 points

Faction = 1 = 0.5 pt

Acq to bottom = 1pt

Total = 7.5 points

Card cost = 8-9 pts

Combat = 6 points

Sac from H/D = 3 pt

Acq to bottom = 1pt

Total = 10 points

Card cost = 8-9 pts

Defense = 5 points
 Combat = 3 points
 Acq to bottom = 1pt
Total = 9 points

Card cost = 10-11 pts

Combat = 9 points
 Acq to bottom = 1pt
Total = 10 points

Card cost = 12-13 pts

Combat = 7 points
 Health = 3.5 points
 Acq to bottom = 1pt
Total = 11.5 points

Card cost = 14-15 pts

Defense = 6 points
 Guard = 1 point
 Combat = 5 points
 Acq to bottom = 1pt
Total = 13 points

Next time you stun a champion gain X gold

Card cost = 7-7.5 pts

Combat = 6 points
 Acq to bottom = 1pt
 Gold on stun = $3 \div 2 = 1.5$
Sub-total = 8.5 points

Card cost = 8-9 pts

Defense = 4 points
 Combat = 2 points
 'Or effect' = 1 point
 Faction = $4 \div 2 \div 2 = 1$ pt
Total = 8 points

If this system is correct, or at least roughly accurate, the general approach is for conditional effects to have their raw values halved. So it makes sense to apply that here.

With Ren, the raw cost of 3 gold is 4 points. We'd halve that for the condition of 'if you've stunned' and halve it again since it's a faction ability.

This approach lands Ren in the expected range (based on 2 combat, and ignoring a variable value for stunning a champ). (As an aside, if 'stun any champion' is valued at 3.5 points, it seems reasonable to halve the cost for being able to stun half of the champions in the game.)

Pit Trap comes out ahead of the curve though. But that's only if it triggers the bonus effect. It's another 'low floor, high ceiling card, albeit its floor not being that low (and still of equal value to similar costing cards).

Double ally abilities (and draw 3)

Card cost = 10-11 pts
 Combat = 7 points
 Discard = 2 points
 Faction = $3 \div 2 = 1.5$
 2 Fac = $3 \div 3 = 1$
Sub-total = 11.5 points

Card cost = 14-15 pts
 Combat = 6 points
 Draw = 3 points
 Faction = $5 \div 2 = 2.5$
 2 Fac = $9 \div 3 = 3$
Total = 14.5 points

If faction/ally abilities are halved, then an ability requiring 2 faction allies to trigger must more than halved, given the lower probability to trigger. So I've opted for factoring by **one-third**.

Applied to the only 2 cards currently with double-ally ability, the results are reasonable.

FMC is the first card we've seen with a potential for 3 draw. I've made a simple extrapolation based on my above assumptions/observations on the value of single/double draw. That is:

1st draw = 3 points
 2nd draw = +5 points (8 total)
 3rd draw = +9 points (17 total)

AoE damage

Cost = 14-15 pts
 Defense = 6 pts
 Dmg opp = 3pts
 Faction = $4 \div 2 = 2$
Sub-Tot = 11 pts
Total w dmg to 1 champion (+3) = 14 points

Cost = 14-15 pts
 Combat = 7 pts
 Draw = 3 pts
 Sac dmg opp = $4 \div 2 = 2$
Sub-Tot = 12 pts
Total w dmg to 1 champion (+4 ÷ 2) = 14 points

Cost = 14-15 pts
 Combat = 7 pts
 Dmg opp = 4 pts
 Draw = 3 pts
 Fac = $3 \div 2 = 1.5$
Sub-Tot = 15.5 pts
Total w dmg to 1 champ (+4) = 18 pts

Cost = 8-9 pts
 Defense = 5 points
 Gold = 3 points
 'Or' = ignore
Tot w gold = 8 pts
Total w 2 dmg to opp (5+2) = 7 points
Total w dmg to 1 champ (5+2+2) = 9 pts

Cost = 12-13 pts
 Defense = 6 pts
 Guard = 1 pt
 Combat = 3 pts
 Faction dmg to 1 champ = $2 \div 2 = 1$
Sub-Tot = 11 pts
Tot w dmg to 2 champs (+2 ÷ 2) = 12 pts

My assessment here (ignoring Demonic Cloud, because IMO it is OP) is that cards with Area of Affect (AoE) damage should be valued on the basis that the effect hits 1 champion as well as damaging the opponent.

Kalibok appears to be the exception to this rule, as his effect does not damage the opponent player. To bring the value in line with other 6-cost cards, this would need to be valued on the basis of hitting at least 2 champions.

The commonality is valuing the effect as if it hits 2 targets (be that 2 champions or 1 champion and your opponent). This makes sense to me, since the limitless ceiling delivers great value, the trade-off should be that the card delivers value below cost-grade if it hits 0-1 targets.

Token generating cards

These appear pretty straightforward. Add the total value of the token champion to the other values of the standard card. As below, Kasha appears overpriced at 3-cost (stats suggest 2-cost would have been more appropriate), and Bjorn is on par.

Card cost = 7-7.5 pts Defense = 3 points Zombie = 3 points Total = 6 points	Card cost = NA Defense = 1 point Combat = 2 points Total = 3 points	Card cost = 10-11 pts Defense = 4 points Guard = 1 point Combat = 3 points Legionnaire = 4 points 'Or' = 1 point Total = 10 pts	Card cost = NA Defense = 2 points Guard = 1 point Combat = 1 points Total = 4 points
--	--	---	--

If you played a champion this turn...

<Sigh> My assessment of these cards (which seems backed-up by community sentiment) is that these cards are some of the most low-value cards currently in the game. Below, I have rated each card as if their effects occurred *every turn* (not just being conditional on playing another champion). As you'll see, 5 of the 8 fall within normal points-value range, 2 below, and the only 1 that rates higher is the one with a sacrifice effect (which we know sometimes misses if you have no cards in your discard pile, and becomes less relevant as the game progresses and you have fewer cards you want to sacrifice). So these cards are average, at best, before layering on the condition to have played a champion to trigger them.

From the perspective of assessing card-cost if you want to use this effect in custom cards, I'd suggest making the effect slightly more powerful (or at least at the higher end of the points value) to offset the likelihood of the card whiffing on subsequent turns. A simple approach would be to give an effect that triggers every turn *and* the extra conditional effect.

Card cost = 6 pts

Defense = 3 points

Discard = 2 points

Total = 5 points

Card cost = 7-7.5 pts

Defense = 5 points

Sac from H/D = 3 points

Total = 8 points

Card cost = 7-7.5 pts

Defense = 4 points

Heal = 2.5 points

Total = 6.5 points

Card cost = 8-9 pts

Defense = 5 points

Guard = 1 point

Draw = 3 points

Sub-Total = 9 points

Card cost = 8-9 pts

Defense = 4 points

Guard = 1 point

Gold = 4 points

Sub-Total = 9 points

Card cost = 10-11 pts

Defense = 6 points

Combat = 5 points

Sub-Total = 11 points

Card cost = 12-13 pts

Defense = 6 points

Guard = 1 point

Draw = 3 points

Sub-Total = 10 points

Card cost = 12-13 pts

Defense = 5 points

Guard = 1 point

Top deck champ = 4 points

Sub-Total = 10 points

Cards with unique effects

Card cost = 6 pts Defense = 2 points Combat = ignore 'Or' = 1 point Sub-Total = 3 points Effect value¹: 2-3 pts	Card cost = 7-7.5 pts Defense = 4 points Gold = 1 point Sub-Total = 5 points Effect value²: 2-2.5 pts	Card cost = 7-7.5 pts Defense = 3 points Gold = ignore for this assessment 'Or' = 1 point Effect value³: 3 pts Total = 7 points	Card cost = 8-9 pts Combat = 5 pts Faction = $3 \div 2 = 1.5$ pts Sub-Total = 6.5 points Effect value⁴: 2.5-3.5 pts
---	--	---	---

¹ Con Artist – As an 'or' effect, we could directly compare value to the alternative 2 Combat (2 points). We can also add the values from the rest of the card (2 def + Or effect = 3 points), which leaves a remainder of 3 points. As we have valued 'gain 2 gold' at 3 points previously, it seems this effect is based on stunning 2 champions (which doesn't seem unreasonable) to generate 2 gold.

² Ratling Collector – A value of 2 pts for 1 combat is over-priced compared, and that's before making it conditional. Perhaps the premium price is because there's no ceiling, but a) we haven't seen that approach used in other cards with no ceiling, and b) the ceiling is limited by how much gold you have, what's available in the market, and your willingness to clog your deck with low-cost cards to trigger this effect. This is an effect not worth the 2pts it seems to have been given. I'd personally value it at **1pt** myself, given it's a conditional 1 combat.

³ Droga – this effect is simply Stun – combat spent; in this case, $4 - 1 = 3$. If the card only offered this effect, it would be lower value than other 3-cost cards. The addition of an 'or' effect brings it to the minimum value of 7 pts (even if the alternative choice of 1 gold is less value at 1 point).

⁴ Smuggle – Earlier, we valued 'put any card from your discard pile to top of your deck' at 6 pts. So this seeming to be valued at 2.5-3.5 feels right, perhaps even slightly on the cheap side. Bottom-decking is so much more variable than top-decking – it could have 10 or more cards on top of it, or it may become the equivalent of a top-deck when your discard pile is empty. If it was only 'move 1 card to bottom' would this be worth half or a third of the value of top-deck? Guided by the 2.5-3.5 pts we see here, I'm content to put a finger in the air and assign **2pts for bottom-decking a single card**, and **3.5pts to bottom-deck up to 2**.

Card cost = 10-11 pts Defense = 5 points Gold = 3 points 'or' = 1 point Sub-Total = 9 points Effect value⁵: 4 pts Total = 5 + 1 + 4 = 10 pts	Card cost = 10-11 pts Defense = 3 points Sac = $(-2 + 8) \div 2 = 3$ Sub-Total = 6 points Effect value⁶: 4-5 pts	Card cost = 12-13 pts Defense = 6 points Fac = $3 \div 2 = 1.5$ pts Sub-Total = 7.5 points Effect value⁷: 4.5-5.5 pts	Card cost = 12-13 pts Combat – 9 pts Fac = $3 \div 2 = 1.5$ pts Acq to bottom = 1pt Sub-Total = 11.5 pts Effect value⁸: 0.5-1.5 pts
--	--	---	--

⁵ Bloodfang – The combat effect here is effectively the cost of discarding a card yourself (-2) + the combat cost (6) = **4 points**. This seems equitable compared to the alternative of 2 gold (3 points). So why doesn't this card have 3 gold (4 points) as the alternative? My guess would be because you're often going to discard a gold to gain the combat, so not taking the combat leaves you with a net 3 gold in most cases.

⁶ James - This effect is like a draw 2 (8) – discard (2) = 6. Lower value may be because you don't actually draw, and must discard one of these two, rather than any from your hand

⁷ Joseph - Cost is roughly similar to James. Premium is likely due to the flexibility to choose how many to draw.

⁸ Rat Swarm – Even the top value of 1.5pts feels quite low for an effect that can be so powerful. But the reality is that on most turns when you play Rat Swarm, you still clear all champions from the board because you don't want them hanging around to trigger faction bonuses. In my experience, it's only really in the late game, when you have, or can get so close to lethal that you utilize the expend and leave champions on the board. When the 'expend all' effect is disregarded, the card comes in just under-value (at 11.5 instead of 12), so perhaps **1.5 pts** is reasonable for this effect.

⁹ Skreet, direct damage – One could argue that direct damage is less valuable than combat, as you cannot use it to clear champions. But you can also argue direct damage is worth more, because it bypasses guards. Hence my decision to keep it as an equivalent **6 points**.

¹⁰ Skreet, market effect – at its base of saving 1g, this is worth 1 pt; arguably less, as 1g saved on a market purchase is less useful

Card cost = 12-13 pts Defense = 5 points Dmg = 6 pts ⁹ Sub-Total = 11 points Effect value¹⁰: 1-2 x2 as faction effect = 2-4 pts	Card cost = 7-7.5pts Gold = 4 points Acquire champ = 1 Sub-Total = 5 points Sac effect values are halved. Effect value¹¹: 4-5 pts
--	---

than 1g that you can spend on your skill if preferred. So, a value of 2-4pts feels excessive for this. If using this for a custom card, I'd value it at no more than **2 points**.

¹¹ Sway – If we value Skreet's discount on any card as being worth 2 points, then Sway's discount on champions only would reasonably be worth 1 point. If this is true, then the cost of the remaining effect is **4-5 points** (halved in this instance, as a sacrifice effect, for total card value to stay in the expected range). Compared to 4 points for a stun effect, this feels reasonable – controlling a champ gets it out of the way for the turn, just as stun does, and gives you the benefit of gaining the champion's prepare and ally effects. But has the downside of the champ going back in play instead of your opponent's discard pile. Are those two aspects equitable? It really depends on the champion you're controlling and the point in the game at which you use the ability. As an average comparison, it seems fine.

Card cost = 7-7.5 pts Gold = 4 points Sac = 2.5 points Sub-Total = 6.5 points Effect value¹²: 1-2pts	Card cost = 7-7.5 pts Faction = 1.5 point Sub-Total = 1.5 points Effect value¹³: 5.5-6 pts
--	---

¹² Summon Aid – The value of 3 gold (4 points) is at least double what this effect is worth (1-2 points) because this card isn't pure economy – unlike 3 gold, you can't add this to other gold to buy a higher-cost card, or use it on your skill. And this effect often give you sub-optimal value when there are only 1-2 cost cards in the market, so taking an average of **2 points** between the value of 1 gold (1 point) and 3 gold (4 points) seems reasonable.

¹³ Confiscate – Interestingly this effect appears to have been valued at the maximum rate (4 gold = 6 points), unlike the average rate we see with Summon Aid. One could argue that Confiscate warrants a premium as its higher value opens up more cards to potentially acquire from the market, but the fact remains you can still have turns where the market is full of cards costing 5 or more, and you can only use this card to grab a Fire Gem, diminishing its value. Personally, I feel using an average value (as with Summon Aid) is more sensible, so if I were to use this effect on a custom card I'd value it at **3-3.5 points**.

Card cost = 10-11 pts

Defense = 5 points

Combat = 4 points

Sub-Total = 9 points

Effect value¹⁴: 1-2 pts

Card cost = 10-11 pts

Defense = 5 points

Faction = $3 \div 2 = 1.5$ pts

Sub-Total = 6.5 points

Effect value⁶: 3.5-4.5 pts

¹⁴ Gornok – Consider it in the context of cards like Smash n Grab – we valued the effect to ‘put *any* card from your discard pile on top of your deck’ at 6 points. Most conditional effects in this game seems to halve the value of the overall effect. But this is, in a way, a 2-layered condition: you must acquire a card *and* it must be Wild. As we saw with Ren, Bounty Hunter, a conditional effect as an Ally bonus was halved, then halved again. I think a similar approach here fits – that is, start with the value of 6 points, then halve and halve again. The result of **1.5 points** for this effect leaves the card within the expected range for its cost.

¹⁵ Daveed – This seems a straightforward calculation based on other card stats. Personally, I almost never buy this card as it feels too situational and rarely gets its value. (This may be because I mostly play Ranger and Barbarian, and end games between turns 7-12, when there is rarely going to be 3+ champions in either players’ deck for this card to give value.) That said for other classes or No Heroes games, it can have more value. Purely from the perspective of valuing this card for designing custom content, I think the value of this type of effect will vary depending on the context in which you’re creating it. That is, if it’s a market card, in a purely custom-market full of champions, or as an effect to a custom class’s (champion-heavy) starting deck, it will be worth more. If you’re creating it as a market card in a deck that can be mixed with official decks (e.g. Base, Dungeons, Journeys) I think it’s over-valued at **3.5-4.5 points**. I’d personally reign it back to something like **2.5 points**.
